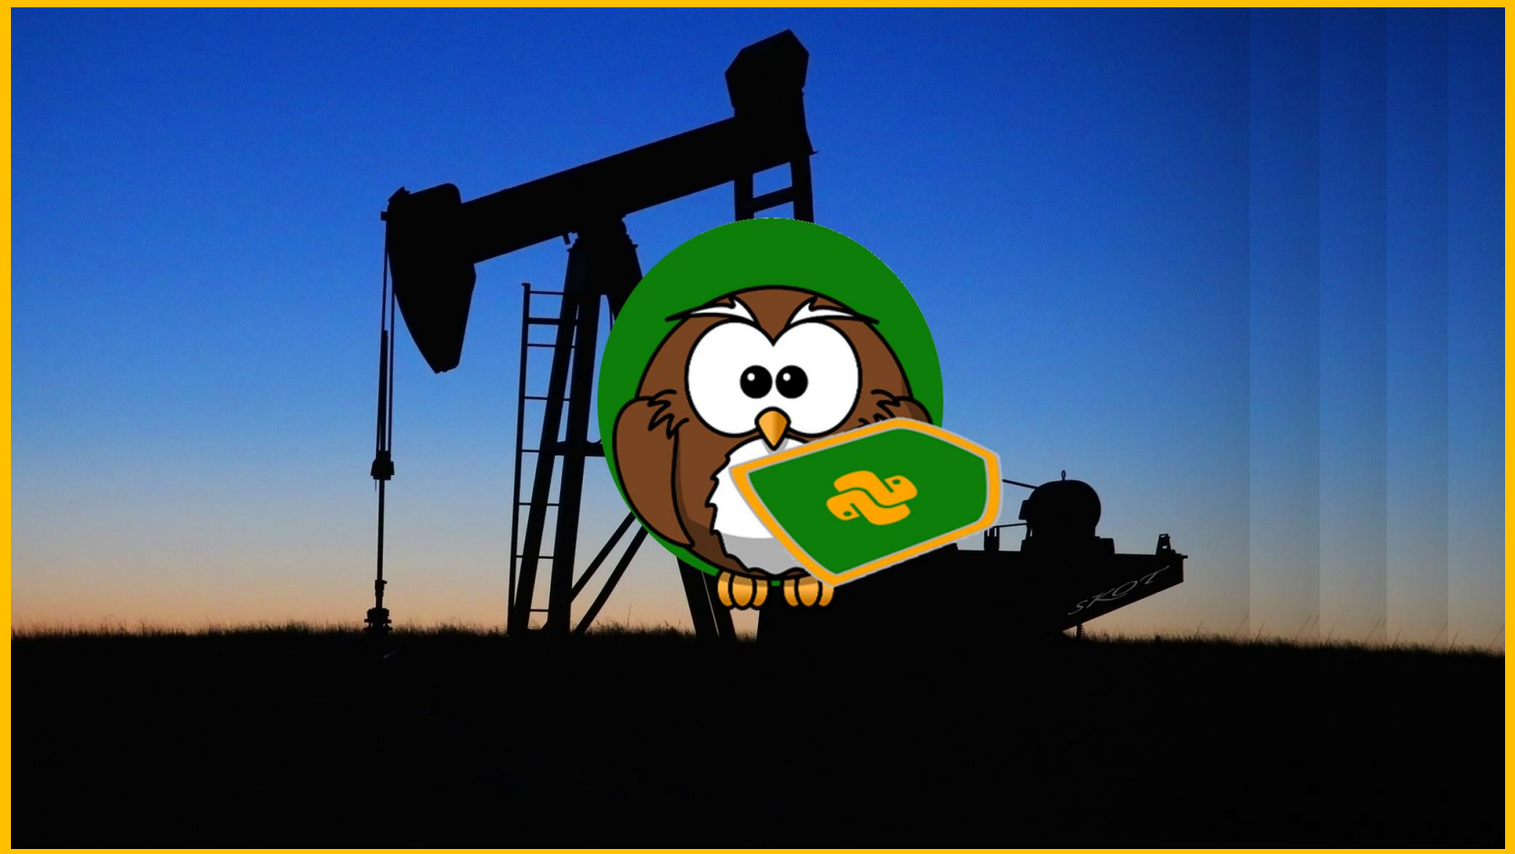
Modern Pythoneering

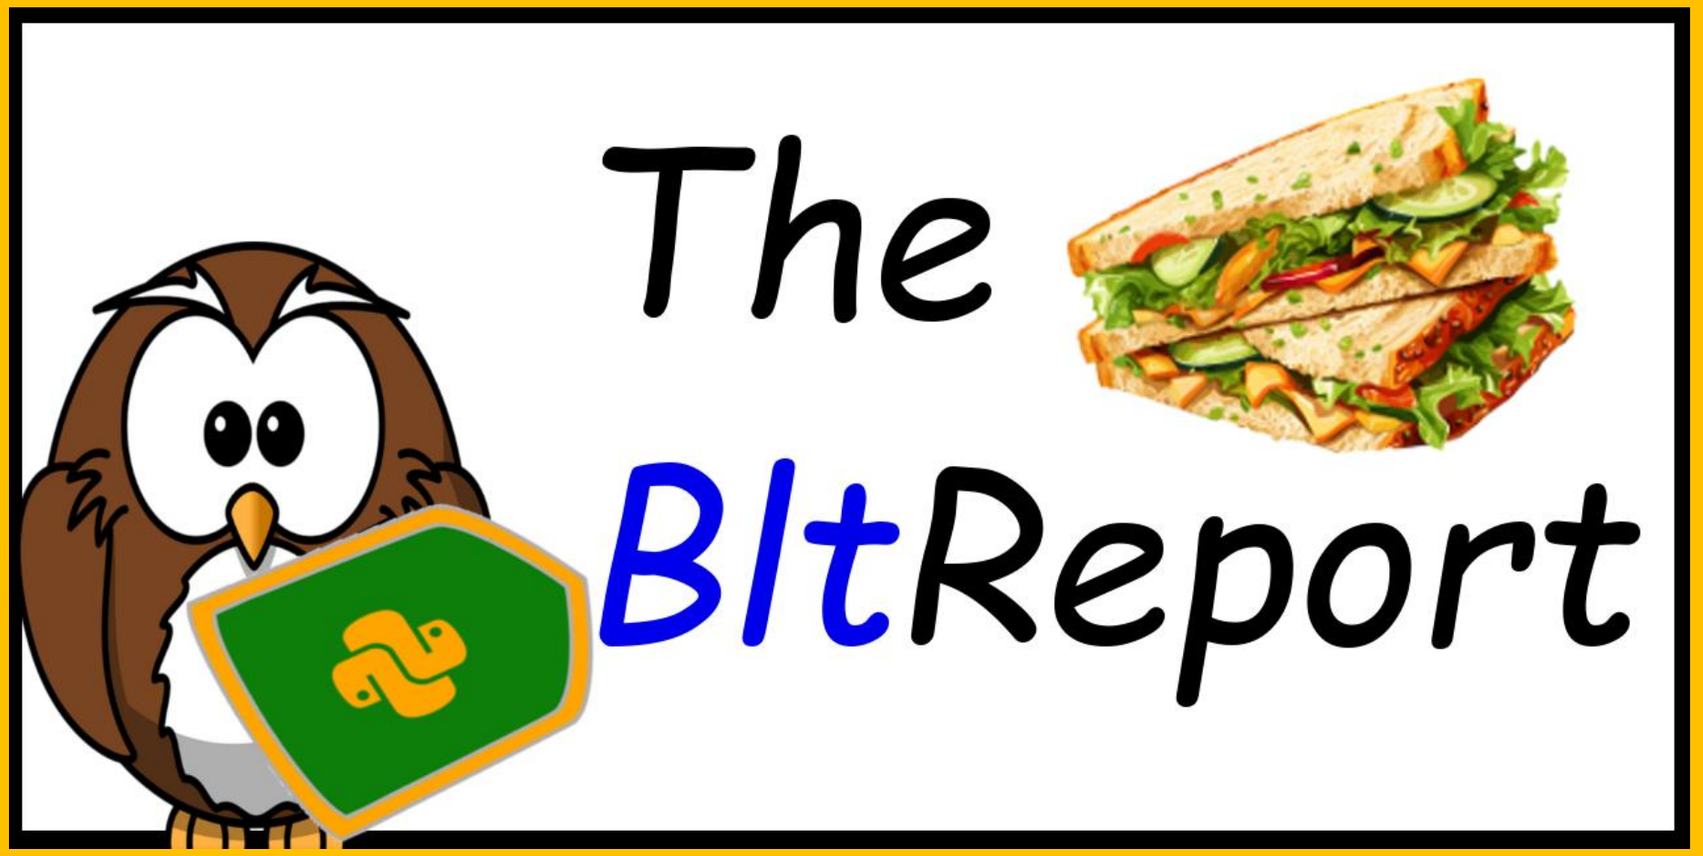
The Built-In Reports

By Randall Nagy

A.K.A: PyQuesting!



Video: BLT_00100



The ‘Upper-Cased’

Keywords:

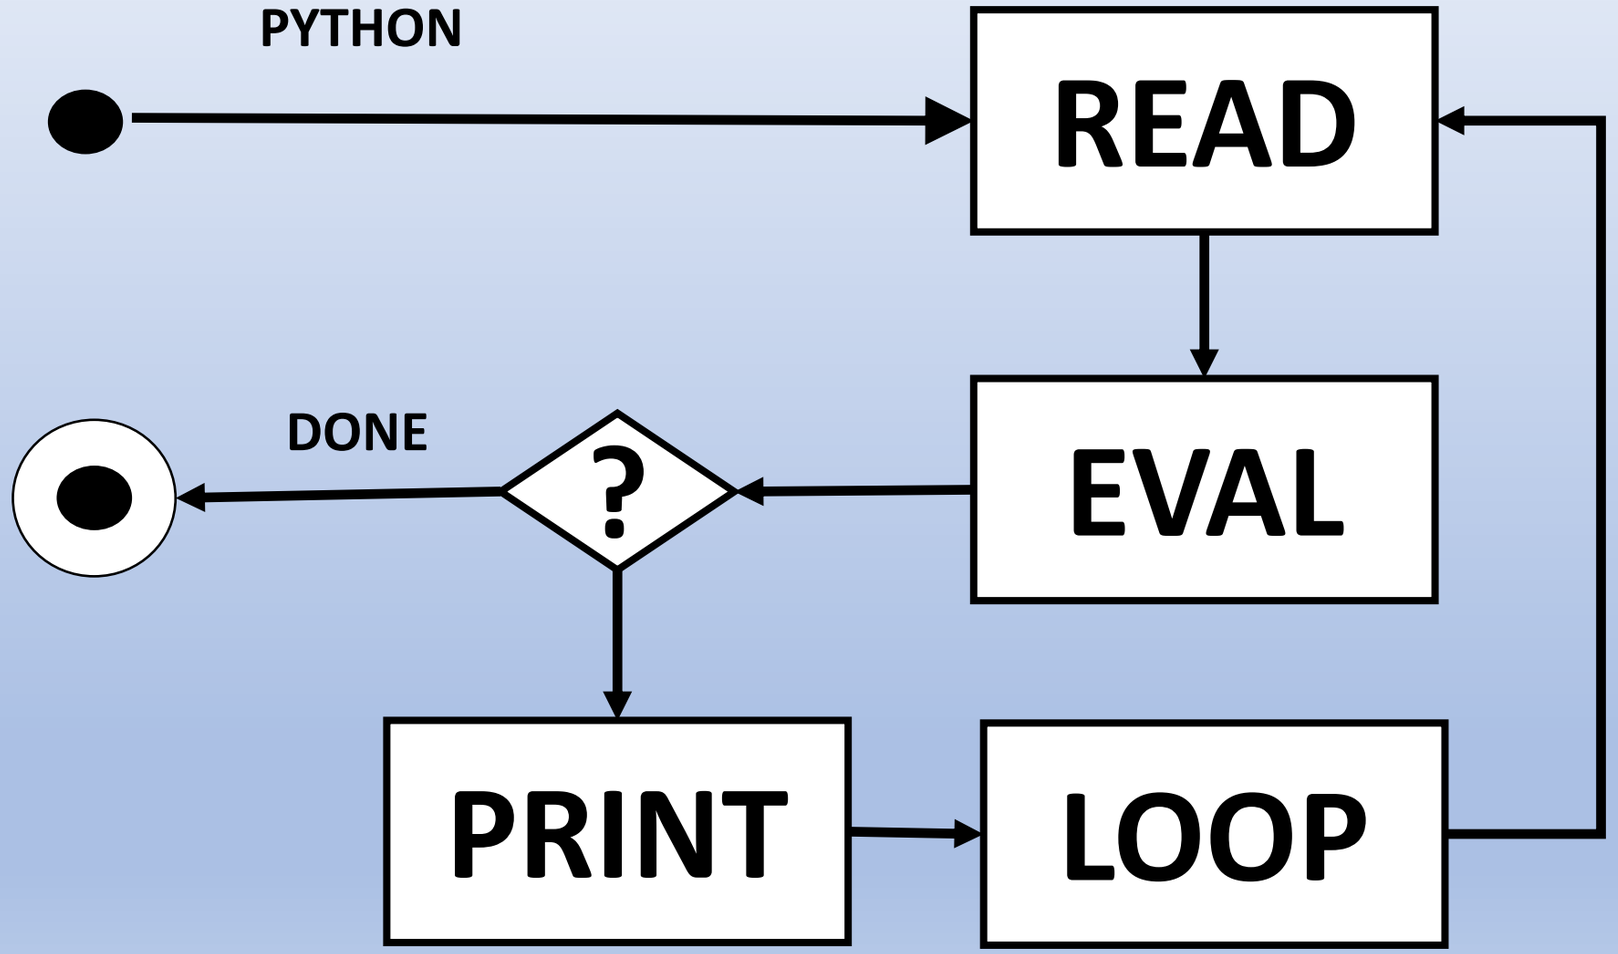
- True
- False
- None

The Built-Ins

Ops:

- type()
- eval()
- bool()
- int()

R.E.P.L ?



KA1002: The REPL

Beginner

What is REPL?

(1) All objects are REPLacable
(2) Read, Evaluate, Print, and Loop
(3) The default version of Python
(4) A well-known research & design pattern
(5) None of the above

KA1056: Boolean Basics

Beginner

Boolean Values:

(1) Either `True` or `False`
(2) Can include `None`
(3) Are default return types
(4) May be lower cased
(5) All of the above

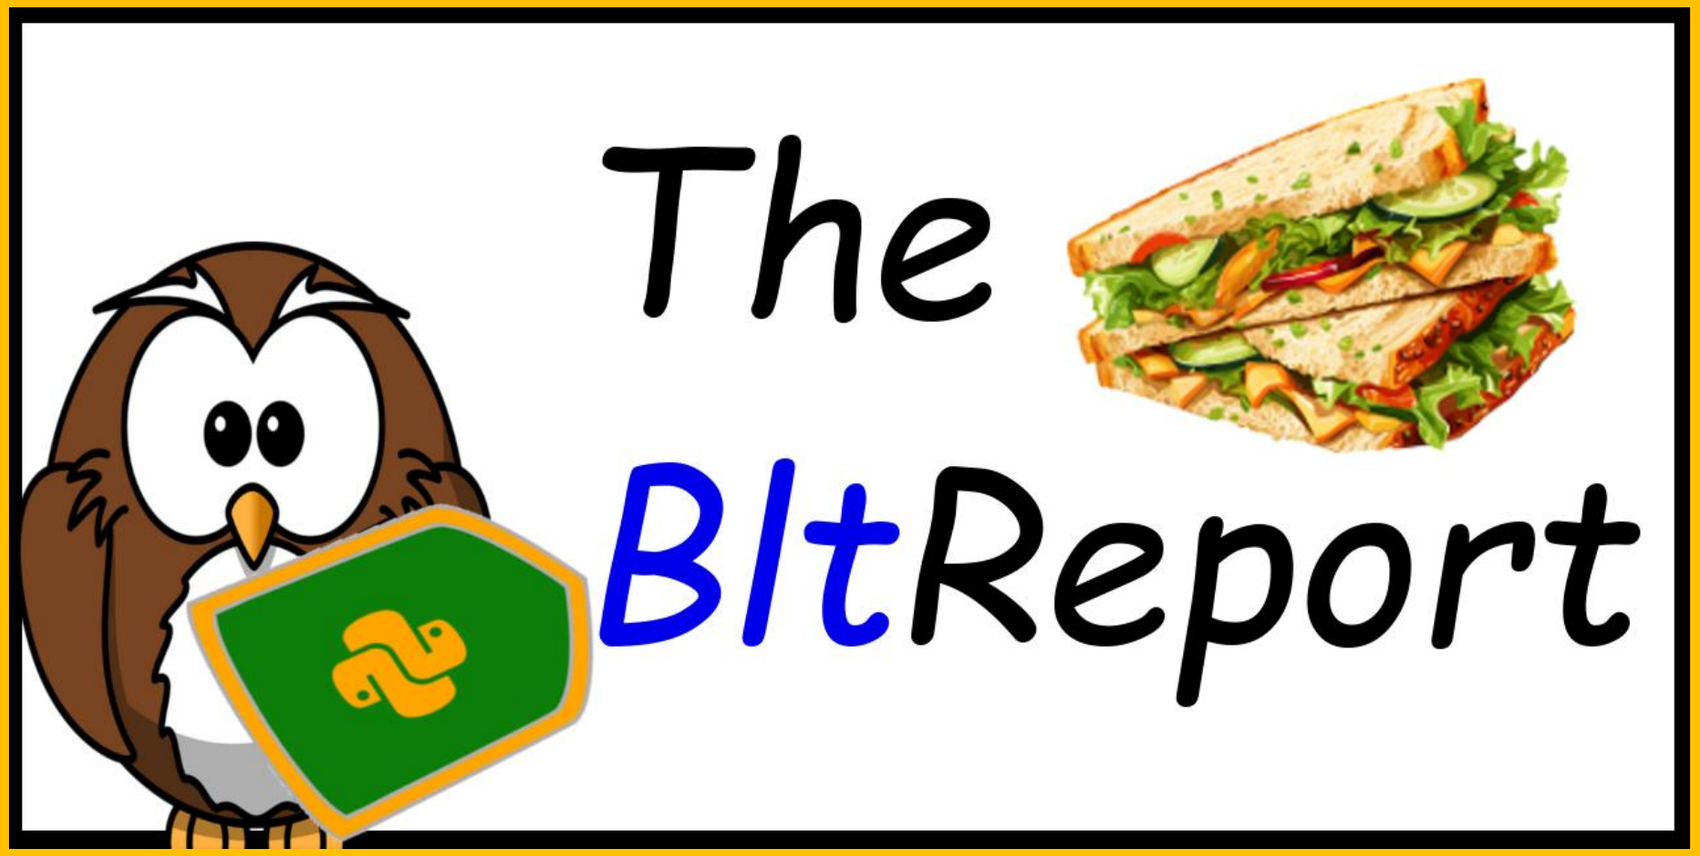
KA1060: Evaluations

Beginner

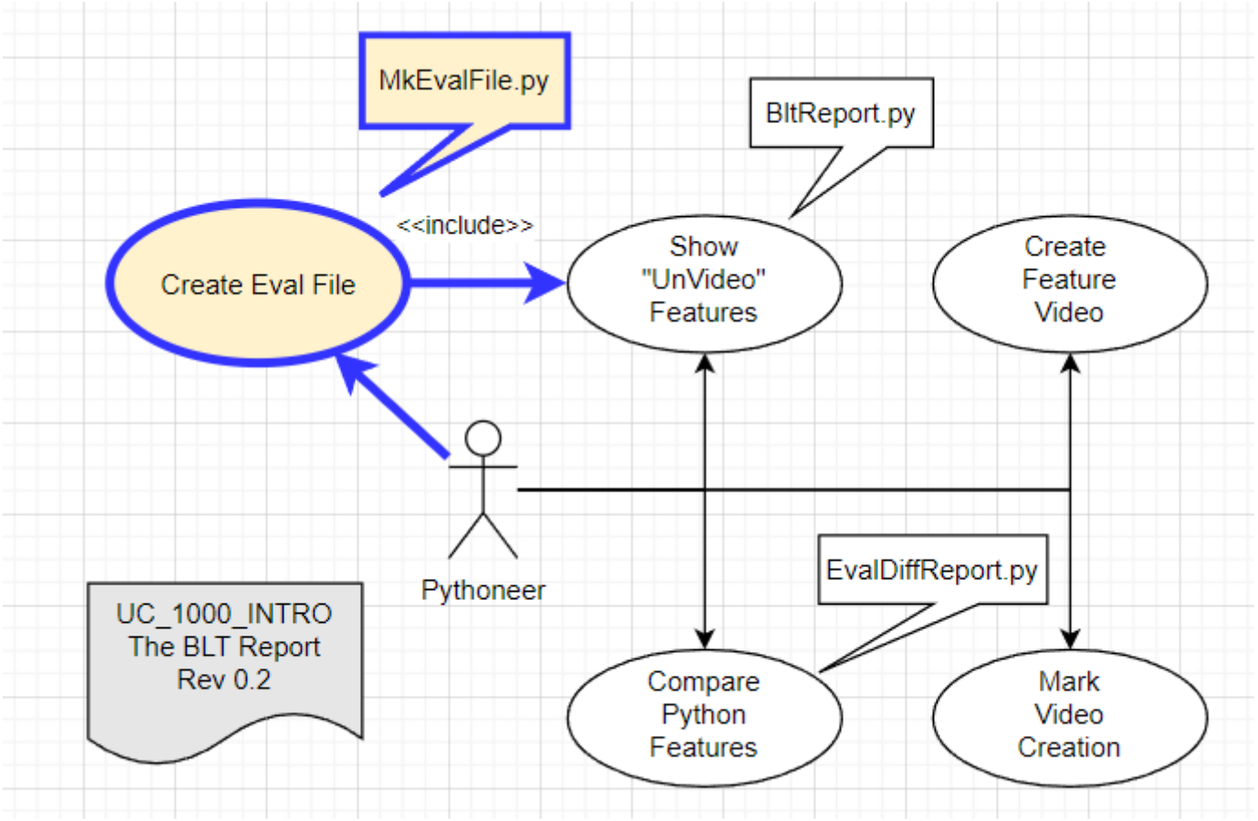
```
eval('bool(1)') will:
```

(1) Raise an Exception
(2) Return True
(3) Return False
(4) Return NoneType
(5) None of the above

Video: BLT_00200



Code Changes



Review

Ops:

- print()
- int()
- bool()
- type()
- eval() …

Reviewing print() Options

```
>>> help(print)
Help on built-in function print in module builtins:

print(...)
    print(value, ..., sep=' ', end='\n', file=sys.stdout, flush=False)

    Prints the values to a stream, or to sys.stdout by default.
    Optional keyword arguments:
    file:  a file-like object (stream); defaults to the current sys.stdout.
    sep:   string inserted between values, default a space.
    end:   string appended after the last value, default a newline.
    flush: whether to forcibly flush the stream.
```

Common int() / bool() Members

- Comprehension

```
>>> print(*[z for z in dir(7) if not z[0] == '_'],sep='\n')
as_integer_ratio
bit_length
conjugate
denominator
from_bytes
imag
numerator
real
to_bytes
>>>
```

.bit_length?

- bool() ~v~ int()

```
>>> bool(1).bit_length()
1
>>> int(1).bit_length()
1
>>> int(255).bit_length()
8
>>> bool(255).bit_length()
1
```

From / To Bytes

```
>>> int(1).to_bytes(2,'big',signed=False)
b'\x00\x01'
>>> int(1).to_bytes(2,'little',signed=False)
b'\x01\x00'
>>> int().from_bytes(b'\x01\x00','little',signed=False)
1
```

```
>>> little = int(1).to_bytes(2,'little',signed=False)
>>> print(little)
b'\x01\x00'
>>> print(int().from_bytes(little,'big',signed=False))
256
```

Conjugate

```
>>> import math
>>> i = int(math.pi)
>>> i.conjugate()
3
>>>
>>> i = int(-math.pi)
>>> i.conjugate()
-3
```

as_integer_ratio

```
>>> help(int(7).as_integer_ratio)
Help on built-in function as_integer_ratio:

as_integer_ratio() method of builtins.int instance
    Return integer ratio.

Return a pair of integers, whose ratio is exactly equal to the
original int and with a positive denominator.
```

Numerator : Ratios

```
>>> int(7).as_integer_ratio()
(7, 1)
>>> int(-7).as_integer_ratio()
(-7, 1)
>>> int(0xe7).as_integer_ratio()
(231, 1)
>>> int(-0xe7).as_integer_ratio()
(-231, 1)
```

Properties

```
>>> int(7).numerator
7
>>> int(7).denominator
1
```

Properties

```
>>> import math
>>> math.pi
3.141592653589793
>>> int(math.pi)
3
>>> i = int(math.pi)
>>> i.imag
0
>>> i.real
3
```

Integral Type Commons

- ✓as_integer_ratio
- ✓bit_length
- ✓conjugate
- ✓denominator
- ✓from_bytes
- ✓imag
- ✓numerator
- ✓real
- ✓to_bytes

Class Dictionaries

- __dict__ ~v~ vars()

```
>>> class Z:
        a=1;b=2
        def __init__(self):
            self.c=7;self.d=8

>>> Z().__dict__
{'c': 7, 'd': 8}
>>> vars(Z())
{'c': 7, 'd': 8}
```

Alternate type() Initialization

- Case Study: BltTypeEx.py

```
class zclass:
    def __init__(self, **kwargs):
        self.times = 1000
        print(f'Created zclass {kwargs}')

normal = zclass(times=3000)
print('1',vars(normal))

other = type('zclass', tuple(), dict(times=9000))
print('2',vars(other))
```

Python Meta

Try this @home?

```
>>> for a in copyright, credits, license:
        print(a)

>>> help("this")

>>> import antigravity
```

KA1061: Integer Values

Beginner

```
>>> int(-255)
```

(1) Exception
(2) -False
(3) True
(4) 255
(5) -255

KA2036: Object Values

Intermediate

We use vars() to:

(1) Create object dictionaries
(2) Manage collection types
(3) Access 'dunder dict' values
(4) Manage string values
(5) Manage integral values

KA2037: Boolean Values

Intermediate

```
>>> bool(-255)

(1) Exception
(2) -False
(3) True
(4) 255
(5) -255
```

KA2038: List Comprehension

Intermediate

```
>>> [c for c in dir(7) if not c[0] == '_']
```

(1) Range Exception
(2) All public members
(3) []
(4) All private operations
(5) None of the above

KA3036: Type Management

Advanced

Use type() to:

(1) Change existing members
(2) Create Objects
(3) Safely remove presence
(4) Determine instance type
(5) Two of the above

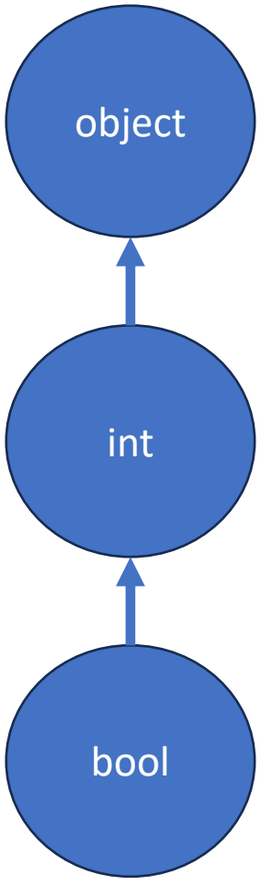
‘isa’ == isinstance()

- Instance ~to~ Recipe(s)
  - isinstance(True, int)
  - isinstance(7, bool)



issubclass()

- Recipe ~to~ Recipe(s)
  - issubclass(True, int)
  - issubclass(7, bool)

Review: type() Initialization

- Case Study: BltTypeEx.py

```
class zclass:
    def __init__(self, **kwargs):
        self.times = 1000
        print(f'Created zclass {kwargs}')

normal = zclass(times=3000)
print('1',vars(normal))

other = type('zclass', tuple(), dict(times=9000))
print('2',vars(other))
```

Built-In hasattr()

Built-In setattr()

Concept: ‘Weak References’?

- More: Python Docs

“A weak reference to an object is **not enough** to keep the object alive …

A primary use for weak references is to implement caches or mappings holding large objects, where it’s desired that a large **object not be kept alive** solely because it appears in a cache or mapping.”
